

Week 11 Report: Report Writing

Project: Analysing the Role of Big Data Analytics for Cyber Threat Detection and Prevention in Banking Organisations of Ireland

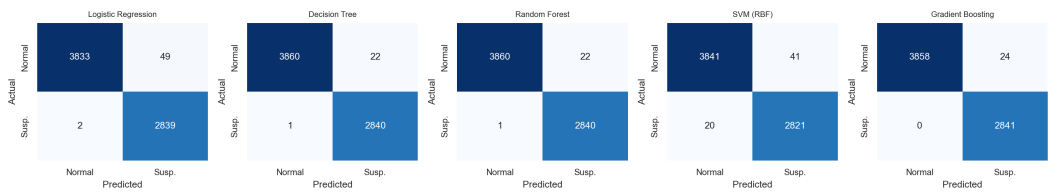

Student: Jayanth Akarapu

Supervisor: Dr. Prasanth Nayak

What I did this week

This week I wrote the design, implementation, evaluation and discussion sections, so the report is now a complete draft. The evaluation section reports the test results, the McNemar tests and all the robustness experiments. The discussion answers each research question and gives recommendations for Irish banks, linking the results to GDPR, DORA and the EU AI Act.

The main message is that very high scores (F1 0.996) are possible on this data, but a simple rule gets almost the same result and the models drop to about 0.866 on new merchants. Banks should use big data analytics to find and maintain simple, auditable risk rules, and test models on new merchants and later time periods before trusting them.

Confusion matrices of the tuned models.

Next week

Proofread, check every number against the results files, and prepare the final submission.
